0. PREMESSA

La presente integrazione al documento Rif. N. D202413930 è volta a rispondere al quesito n. 10 posto da Regione Liguria Prot-2024-1564135 del 17/10/2024 relativa alla rappresentatività del periodo di monitoraggio in raffronto con le caratteristiche anemologiche del sito oggetto di valutazione collocato in Cairo Montenotte e Savona. Le valutazioni che seguono si basano sui dati alle turbine rilevati per il periodo 01/05/2024-30/09/2024.

1. DESCRIZIONE DELL'AREA OGGETTO DI VALUTAZIONE

Il sito in oggetto ricade all'interno dei Comuni di Cairo Montenotte e Savona (SV), in Loc. denominata "Surite del Cuculo", al confine tra la parte meridionale del Comune di Cairo Montenotte e quella settentrionale del Comune di Savona.

L'area è ubicata lungo una linea di crinale ad un'altezza di circa 450 m s.l.m.; la zona circostante il sito è prevalentemente boschiva, caratterizzata dalla presenza di alberi di medio fusto.

L'orografia delle aree oggetto di valutazione è complessa.

P11 si trova in posiziona avvallata rispetto ad entrambe le turbine che non risultano in vista al punto di osservazione. A livello cautelativo si ipotizza un potenziale contributo acustico da entrambe le turbine.

P02 si trova in vista della turbina T2: punto di misura e base turbina sono a quote diverse, pertanto il punto di misura si trova praticamente allineato alla turbina T2.

2. ELABORAZIONE DEI DATI ANEMOLOGICI

Si riportano nel seguito le rose dei venti elaborate sulla base dei dati misurati in corrispondenza delle turbine e forniti dal Committente per il periodo 01/05/2024-30/09/2024. Le rose dei venti per ciascuna turbina sono messe a confronto con le rispettive rose dei venti elaborate per il periodo 17/06/2024-03/07/2024, corrispondente al periodo di campionamento fonometrico.

Come si evince dalle rappresentazioni sopra riportate, le rose dei venti elaborate sui tempi di campionamento sono fondamentalmente sovrapponibili sia per direzione sia per intensità con le rose dei venti elaborate sul periodo esteso 01/05/2024-30/09/2024.

Per la turbina T2, che risulta essere potenzialmente più impattante per entrambi i recettori considerati poiché più vicina, sono state effettuate anche delle valutazioni circa le classi di vento, dove le classi sono state definite come 1 per venti compresi tra 0 e 1 m/s, la classe 2 per venti compresi tra 1 e 2 m/s, etc.

Nel periodo di campionamento fonometrico è stata rilevata, per le classi di vento 7 – 8 – 9 – 10, cioè per velocità del vento comprese tra 6 m/s e 10 m/s, una percentuale di accadimenti più elevata rispetto a quella riscontrata dal *01/05/2024-al 30/09/2024*. Le classi di vento inferiori a 7 risultano comunque rappresentate, sebbene le percentuali di accadimento di tali classi siano inferiori a quelle relative al periodo esteso; le classi di vento sopra la classe 10 risultano scarsamente o per niente rappresentate ma anche sull'intero periodo di 01/05/2024-30/09/2024 tali classi sono raramente rappresentate.

3. CONCLUSIONI

Quanto riportato ai precedenti paragrafi consente di verificare che il periodo di campionamento 17/06/2024-03/07/2024 è senz'altro rappresentativo delle condizioni abituali di direzione e intensità del vento se confrontati con i dati rilevati alle turbine nel periodo 01/05/2024-30/09/2024. Inoltre, le condizioni anemologiche riscontrate nel periodo di campionamento, evidenziano una situazione legata alle intensità del vento leggermente più ricorrente per le classi di vento 7 – 8 – 9 – 10, risultando quindi, come periodo, più ventoso rispetto al periodo esteso. Conseguentemente, considerata anche l'orografia dell'area, il fatto che ai recettori le classi di vento più elevate risultino non rappresentate durante il periodo di campionamento 17/06/2024-03/07/2024 è da considerarsi come condizione abituale dovuta alla collocazione dei recettori stessi e non come evento atipico.
